

Opening and closing the window

Open window by turning pegstake 90°, pushing window outwards, and positioning pegstake on retaining dowel. The window has three opening positions. Close window by lifting pegstake from retaining dowel and fastening it onto locking dowel.

Net blind

Ex factory the window has been fitted with a net blind, which can be pulled down and retained in the brackets at the sides.

Removing the sash (to clean the pane etc.)

Open window 90° and pull sash towards the right until it is free of the hinges, then lift sash through opening.

Minimising condensation

Particularly in rooms with high levels of humidity, condensation can form on the inner pane of the window. This can be minimised by airing the room frequently.

Cleaning the window

The surface can be cleaned with ordinary household cleaners.

Cleaning the flashing

Leaves and other debris should be removed from the flashing around the window to allow rainwater to flow freely.

Snow and ice

It is important to make sure that water can always drain off from the window and surrounding gutters. Snow and ice should therefore be removed from the area on and around the window in the same way as leaves and other debris should be removed from flashing and gutters to allow melt water to flow freely.
