The VELUX Group is aware of the demand for information about recycled content and sustainably sourced materials in construction products.

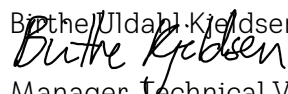

The biggest material streams in our production are glass (glazing), wood (frame), aluminium (cladding, frame etc.), steel (fittings). The amount of recycled content in these material streams are the following:

Glass: min 12 % recycled content
Aluminium: min 43 % recycled content
Steel: min 10 % recycled content
Polyurethane plastics: 0 %

Wood: 100 % renewable – the VELUX Group uses FSC and PEFC-certified wood.

As part of our corporate responsibility work, the VELUX Group works with local authorities, and recyclers as well as pursues technology developments to promote the recyclability of our products when their functional life is coming to an end.

We are furthermore working to source a higher proportion of recycled and lower carbon materials and integrate them into our existing products. We are designing new products to optimise material use and to achieve a lower carbon footprint per product.

Birthe Uldal Kjaersden

Manager, Technical Values
